Yellowstone Park is one of the most **fascinating** places in the USA. There are thousands of hot **springs** and **geysers**. It is visited by millions of **tourists** every year. Only recently have they begun to understand what they are looking at. Yellowstone Park is **actually** the largest active **volcano** in the world. It covers the **area** of almost 4,000 square kilometres. The last big **eruption** caused the **ash** from the volcano to cover most parts of the North America and the change of **climate**. During the **volcanic** winter, clouds of dark ash hid the sun. It was so cold that many **species** of animals and plants disappeared from the Earth. The volcano is still alive today. Tests have shown that thousands of **earthquakes** happen every year. They remain **unnoticed** since they are very weak. However recently the number of earthquakes has **increased** and in some parts the **level** of the ground has risen. In the last 2.1 million years there have been three **super** eruptions. Most experts believe there is no **immediate** danger of another giant **explosion**, but it's impossible to be sure.
